This paper describes the igneous geology, alteration mineralogy, and geochemistry, as well as the ore mineralization history of Bajo de la Alumbrera, a world-class porphyry copper-gold deposit in northwestern Argentina. The deposit occurs in the K-rich calc-alkaline Farallón Negro Volcanic Complex, located 200 km east of the main Andean ...

alteration is defined as any alteration of rocks or minerals by the reaction of hydrothermal fluid with preexisting solid phases. Hydrothermal alteration can be isochemical, like meta-morphism, and dominated by mineralogical changes, or it can be metasomatic and result in significant addition or removal of elements.

Abstract. Carbonate sediments and rocks are valuable archives of Earth's past whose geochemical compositions inform our understanding of Earth's surface evolution. Yet carbonates are also reactive minerals and often undergo compositional alteration between the time of deposition and sampling and analysis. These changes may be mineralogical, structural, and/or chemical, and they are broadly referred to as diagenesis.

Isocon analyses of whole rock geochemical data from altered porphyry indicate the following relative changes during alteration: (1) consistent, near total losses of Na and Pb, (2) increasing gains of Mg, Fe, Mn and Zn, and increasing losses of Si and Sr with increasing alteration intensity, (3) gains of Ti, Cr and U, and losses of K and Rb upon alteration of feldspar phenocrysts, and (4) losses of Zr, Nb, Y and Th upon the loss of quartz in the groundmass.

Abstract Despite the robust nature of zircon in most crustal and surface environments, chemical alteration, especially associated with radiation damaged regions, can affect its geochemistry. This consideration is especially important when drawing inferences from the detrital record where the original rock context is missing.

The overall trace element geochemistry of the altered wall rock is controlled by the initial composition of the wall rocks and the ore-fluid composition. Hydrothermal ore-forming fluids are recognized as CO<sub>2</sub>-rich near-neutral reduced fluids with high values of H<sub>2</sub>S, K, and S content.
